

BUSINESS REQUIREMENT V2

1. For there to be multiple playlists, I created another table called `playlist_songs` on my schema. If you refer to my ERD and schema, I have already implemented it. It will be a one to many relationship with the `playlist` table.

2. To have an account type, you would just create a new variable called `account type` in the `user` table and default to `free` with a `varchar(255)` and have it not null.
